Mustard Bio

Vision

To become the intelligence layer powering the next generation of pharmaceutical factories worldwide.

We envision a future where pharmaceutical manufacturing is increasingly autonomous, intelligent, efficient, and accessible, transforming how essential medicines are produced and supplied globally.

Mission

To develop, validate, and commercialise intelligent manufacturing systems that make pharmaceutical production faster, more efficient, reliable, and cost-effective.

We are building technology-enabled pharmaceutical factories, beginning in Nigeria, that serve two interconnected purposes:

1. **Commercial manufacturing:** Produce medicines for pharmaceutical companies and brands through contract and white-label manufacturing.
2. **Technology development:** Deploy, test, and continuously improve manufacturing software and automation systems in real-world production environments, with the goal of commercialising proprietary technology for other manufacturers.

Long-Term Ambition

To establish Mustard Bio's technology as a foundational intelligence infrastructure for pharmaceutical manufacturing globally, with the potential to extend into other industries.

Core Positioning

Mustard Bio is the intelligence layer for the pharmaceutical factories of the future.
